

RegalGraze Ladino Clover

**Preferred by wildlife
in game food plots**

RegalGraze Ladino Clover

Winterhardy, palatable and widely adapted for wildlife.

Variety Development

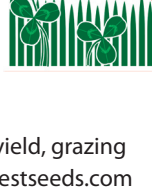

A variety tracing to 162 parent plants selected after two cycles of continuous, abusive grazing with high stocking rates of beef cattle at the University of Georgia's Eatonton Station. The resulting variety has been widely tested for adaptability, yield, grazing tolerance and animal preference.

Field Appearance

RegalGraze features a showy, upright growth habit, fine stems that support large, dark green leaves and active stolon growth. Plants are tolerant or resistant to the common diseases found in the area of adaptation.

Overgraze Protection™

After aggressive or abusive grazing, RegalGraze with bred-in Overgraze Protection has the ability to rejuvenate itself via active stolon growth or by self-seeding. Doesn't crowd out or take out desired perennial grasses like the small or intermediate white clover leaf types tend to do over time.

Public Testing and Evaluation

The variety has been evaluated for adaptability, yield, grazing tolerance and animal preference. Visit www.calwestseeds.com for results and head-to-head comparison versus competitive white clovers.

Given a Choice, Wildlife Prefer the Taller, Leafier and More Palatable RegalGraze Ladino Clover

Canopy Height

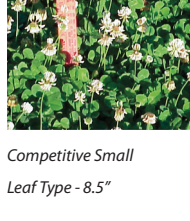

RegalGraze is a true ladino clover with a significantly taller canopy height than that of intermediate and small leaf types. When grown side by side, RegalGraze will have a third more top growth height than most intermediate leaf types and fifty percent more than common small leaf types at flower, giving it more visual appeal to wild game.

RegalGraze - 13.5"

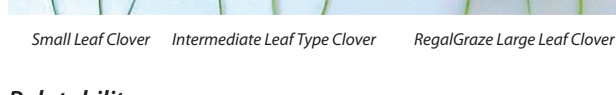

Popular Intermediate
Leaf Type - 10"

Competitive Small
Leaf Type - 8.5"

Leaf Size

The leaf size of RegalGraze is approximately double the size of an intermediate leaf type and more than three times larger than a competitive small leaf type. Larger leaves mean more total leaf area per plant and increased animal intake potential.

Small Leaf Clover

Intermediate Leaf Type Clover

RegalGraze Large Leaf Clover

Palatability

RegalGraze contains low levels of anti-quality cyanogenic glucosides, unlike some small and intermediate white clovers. University data has documented cattle preferences for RegalGraze over a number of intermediate and small leaf white clovers.

Given a Choice, Wildlife Prefer the Taller, Leafier and More Palatable RegalGraze Ladino Clover.

- Tall Growing
- Large, Palatable Leaves
- Low Cyanogenic Glucoside Content
- Compatible with Other Species in Mixes
- Widely Adapted and Tested
- Lasts Season After Season
- Attracts Big Game

Convenient and Easy to Use

RegalGraze is available in handy Sportman's Buckets for game food plot use. One bucket seeds approximately one acre.
